Chapter 10

Computer networks

1. The ping commands checks whether a device is reachable over a network and measures response time. A "no reply" does not always mean the website down because its firewall may block ping requests even when the website working.

2. The internet uses NAT (Network Address Translation)
   - multiple devices in a home or office can share one public IPV4 address
   - Each device gets a private IP adress
   - the router uses NAT to connect these devices to the internet
   - this allows billion of devices to use a limited number of public IPV4 addresses
