# Chapter 6

1. Environment variables are variables that store information about the system & its working environment
- They help programs and commands get important information from the operating system.

2. • Path is an environment variable that contains a list of directories where executable commands are stored
How Path works
Type "ls" in Terminal → Shell checks Path → Searches /usr/bin, /bin, etc. (find executable) → runs it
3 • If Path is empty
Normal commands like ls may not work because the shell cannot find them through path
• But /bin/ls still works we provide it absolute path

• The which command tells us the location of executable found through path
