# Chapter 9

## Git & Version control

1) Yes I participated in Hacktoberfest and learned how to create and share a repository using Git and Github. I used commands like git init, git add, git commit, git push, git pull & git log, git merge I think git in SSAI course is very useful because it teaches us how to manage code, track changes and work together on ~~page~~ projects.

2. Git was created by Linus Torvalds in 2005. He developed it to manage the linux kernel source code. The existing version-control system was no longer suitable for the needs of linux developers. Git is designed to be fast, reliable and support collaborative development

3) working tree clean means there is no uncommited changes in the repository. All changes have been committed and there are no modified or untracked file.

Yes I have see "working tree clean" after commiting all my changes using Git
